Materials and Instruments

Chemicals were purchased from the Merck chemical companies. Thin-Layer Chromatography (TLC) on commercial plates of silica gel 60 F254 was used to monitor the progress of reactions. The products were characterized by FT-IR spectra, ^1H NMR, ^{13}C NMR. FT-IR spectra were recorded on Shimadzo FT-IR 8400 instrument. ^1H and ^{13}C NMR spectra were recorded on Bruker Advance Spectrometer 300 MHz and 75 MHz respectively, using $\text{CDCl}_3\text{-}d$ as solvent. The chemical shifts are expressed in parts per million (ppm) and tetramethylsilane (TMS) was used as an internal reference. Melting points were recorded on a THERMO SCIENTIFIC 9100 apparatus.

General procedure for the synthesis of α,α' -bis(substituted-benzylidene)cycloalkanones (3)

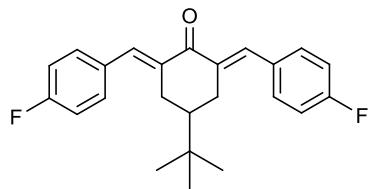

A mixture of cyclohexanone (1 mmol), aromatic aldehyde (2 mmol) and 0.032 g n-TSA was stirred at 90 °C under solvent-free condition for an appropriate time. After completion of the reaction (monitored by TLC), hot ethanol was added and the catalyst was filtered. The title compounds were obtained in their yellowish crystalline forms by recrystallization of ethanol solution.

General procedure for the synthesis of xanthenes (5)

A mixture of α,α' -Bis(substituted-benzylidene)cycloalkanones (1 mmol), dimedone (1 mmol) and 0.012 g n-TSA was added in a test tube and heated in an oil bath at 130 °C under solvent-free condition for an appropriate time. After completion of the reaction (monitored by TLC), hot ethanol was added and the catalyst was filtered. The products were obtained in white powder by recrystallization of ethanol solution.
