#### Abstract

2,5-Bis(pyrrol-2-yl)phosphole derivatives were prepared using the reaction of titanacycles, generated in situ from a $\mathrm{Ti}^{\mathrm{II}}$ reagent and pyrrole-capped 1,6-heptadiynes, with dichloro(phenyl)phosphine. The 2,5-bis(pyrrol-2-yl)phosphole derivatives were found to possess narrower optical HOMO-LUMO gaps and less positive oxidation potentials than those of previously reported 2,5-diarylphosphole analogs. This demonstrates that the intrinsic nature of the electron excessive pyrrole subunits as well as the effective $\pi$ conjugation over the coplanar heterole rings. The $\sigma^{3}-\mathrm{P}$ type 2,5-bis(5-phenylpyrrol-2yl)phosphole underwent complexation with $\mathrm{AuCl}\left(\mathrm{SMe}_{2}\right)$ and $\mathrm{PtCl}_{2}$ to yield the respective AuCl -monophosphine and $\mathrm{PtCl}_{2}$-bisphosphine complexes. In the square planar $\mathrm{Pt}^{\mathrm{II}}$ complex, the pyrrolic NH protons were found to form intramolecular hydrogen bonds with the chlorine atoms that gave rise to symmetrically split, parallel $\pi$-chromophores linked by two $\mathrm{Pt}-\mathrm{P}$ bonds. Density functional theory calculations on a $\mathrm{Pt}^{\mathrm{II}}$ model complex suggested that this cooperative interaction induces a significant split of the original LUMOs of the symmetrical $\pi$-conjugated ligands.

## 1. Introduction

Phosphole, the phosphorus analog of pyrrole, possesses a low-lying LUMO due to effective $\sigma^{*}-\pi^{*}$ orbital interaction between the phosphorus center and the polarizable 1,3 -diene unit. In addition, the LUMO and HOMO energy levels of phosphole can be controlled by chemical functionalizations at the phosphorus center. These characteristic properties of phosphole are beneficial for the construction of unprecedented classes of optical and electronic materials [1]. In fact, phosphole-linked $\pi$ conjugated systems of general formula $\mathbf{A}$ have recently received increasing attention, and their fundamental properties have proven to depend strongly on the $\pi$ conjugative substituents. Most of the preceding examples
of type A compounds include benzene (phenyl or phenylene) [2], pyridine (2-pyridyl) [3], and thiophene (2-thienyl, 3-thienyl, etc) [4] moieties as the $\alpha$-substituents, where synergetic effects derived from each component have been exhibited in the optical and electrochemical properties of the entire $\pi$-systems. It is well known that HOMO of pyrrole is located at a higher energy level than HOMOs of benzene, thiophene, and pyridine. ${ }^{1}$ In this regard, pyrrole-phosphole-pyrrole $\pi$ systems are expected to release electrons easily as compared with known arene-phosphole-arene hybrids of type $\mathbf{A}$. Such properties would be promising to construct a new class of redox active hybrid heterole $\pi$-systems. It is also anticipated that pyrrolic NH groups may act as

[^0][^1]hydrogen-bond donors toward Lewis basic functions attached to the phosphorus center. To our knowledge, however, the utilization of pyrrole as the $\alpha$-substituent has gained quite a little attention in phosphole chemistry [5]. ${ }^{2}$
solid in $28 \%$ yield based on $\mathbf{2 b}$, whereas the $\alpha$-free derivative 4a was difficult to completely purify due to its instability in atmospheric environment. Therefore, 4a was used for subsequent transformations without isola-

In 2006, we established a convenient method for the synthesis of $\alpha, \alpha^{\prime}$-difunctionalized phospholes via titanacycles generated from Sato-Urabe's Til ${ }^{\text {II }}$ reagent [6] and the corresponding terminal-substituted 1,6-heptadiynes [7,8]. ${ }^{3}$ This protocol has proven to be effective for the construction of arene-capped phosphole-vinylene [9], phosphole-acetylene [10], and phosphole-triazole [11] $\pi$-systems with characteristic properties derived from the respective components. Herein, we report a new shortstep synthesis of 2,5-bis(pyrrol-2-yl)phosphole derivatives based on the titanacycle protocol and their optical, electrochemical, and coordinating properties. In this study, we aimed to elucidate the characteristic features of the pyrrole substituents by comparison with those of the other arene substituents in type A phosphole derivatives. Both experimental and theoretical results demonstrate that the attachment of the pyrrole substituents is highly promising for developing a new class of $\pi$-conjugated phosphole derivatives with multiple functions derived from these two group 15 heteroles.

## 2. Results and discussion

### 2.1. Synthesis of 2,5-bis(pyrrol-2-yl)phosphole derivatives

Scheme 1 illustrates the synthesis of 2,5-bis(pyrrol-2yl)phosphole derivatives and 2,5-bis(5-phenylpyrrol-2yl)phosphole derivatives. The starting materials, pyrro-lyl-capped 1,6-heptadiynes 2a,b, were prepared by Sonogashira coupling of terminal-free 1,6-heptadiyne and the corresponding 1-Boc-2-iodopyrroles (Boc $=t$-butoxycarbonyl) 1a,b [12,13]. Reactions of $\mathbf{2 a}$ and $\mathbf{2 b}$ with ( $\eta^{2}$ propene) $\mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{2}$, generated in situ from $\mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{4}$ and 2 equiv of $i-\mathrm{PrMgCl}[6]$, followed by treatment with $\mathrm{PhPCl}_{2}$ gave $N$-Boc-protected 2,5-bis(pyrrol-2-yl)phosphole 3a (43\%) and 2,5-bis(5-phenylpyrrol-2-yl)phosphole 3b, respectively. Compound $\mathbf{3 b}$ could not be separated from unreacted $\mathbf{2 b}$ and was used as a mixture in the following $N$ Boc deprotection step. The $N$-Boc groups of 3a,b were successfully removed by the reaction with sodium methoxide in methanol to give $\sigma^{3}$ derivatives 4a,b. The phenyl-capped derivative $\mathbf{4 b}$ was isolated as an air stable

[^2]tion. On treatment with hydrogen peroxide or $m$-chloroperbenzoic acid ( $m C P B A$ ), each $\sigma^{3}$-phosphorus center of $\mathbf{4 a , b}$ was readily oxygenated, affording the corresponding $P$-oxides 5a,b. When treated with elemental sulfur, 4a,b were converted to $P$-sulfides $\mathbf{6 a , b}$.

The pyrrole-phosphole-pyrrole hybrids 3-6 were characterized by conventional spectroscopic techniques ( ${ }^{1} \mathrm{H},{ }^{13} \mathrm{C},{ }^{31} \mathrm{P}$ NMR, high-resolution MS, IR) and elemental analysis. Although 4a gradually decomposed in solution, its structure was confirmed by NMR spectroscopy and MS spectrometry. The ${ }^{31} \mathrm{P}$ peaks of the $\sigma^{4}$ derivatives $\mathbf{6 a , b}\left(\delta_{\mathrm{P}}\right.$ $63.4,63.6$ ) and 5a,b ( $\delta_{\mathrm{P}} 54.3,55.6$ ) were observed at downfield compared to those of $\mathbf{4 a , b}\left(\delta_{\mathrm{P}} 28.1,28.5\right)$, which clearly reflects differences in the electronic character and the oxidation state of phosphorus. In the ${ }^{1} \mathrm{H}$ NMR spectra, 3-6 showed only one set of pyrrolic CH and NH protons, indicating that all of these compounds have $C_{s}$ symmetry in solution. The NH protons of $\alpha, \alpha^{\prime}$-free derivatives 4a, 5a, and $6 \mathbf{a}$ appeared at $\delta 8.01,9.09$, and 9.61 , respectively. The same holds true for a series of the phenyl-capped derivatives 4b ( $\delta 8.26$ ), 5b ( $\delta 9.28$ ), and 6b ( $\delta 9.96$ ). Judging from the downfield appearance of the NH peaks of 5 and $\mathbf{6}$ relative to those of $\mathbf{4}$ and free pyrrole ( $\delta 8.0$ ), there may exist hydrogen-bonding interaction between the NH protons and the chalcogen atoms bound to phosphorus in 5 and 6. To get some insight into relative conformation between the pyrrole and phosphole rings in solution, we also measured NOESY spectra for $\mathbf{4 b}$ and $\mathbf{5 b}$ in $\mathrm{CD}_{2} \mathrm{Cl}_{2}$. In both cases, the NH proton and one of the $\beta$-CH protons of the pyrrole ring show nuclear Overhauser effects (NOE) toward allylic methylene protons of the trimethylene bridge fused to the phosphole ring. This result implies that the inter-ring $\mathrm{C}_{\alpha}-\mathrm{C}_{\alpha^{\prime}}$ bonds between pyrrole and phosphole rings rotate rapidly in solution on the NMR timescale. In the IR spectra of $\mathbf{5 a}$ and $\mathbf{5 b}, \mathrm{P}=\mathbf{O}$ stretching frequencies were observed at $v 1165$ and $1180 \mathrm{~cm}^{-1}$, respectively. The $\nu_{\mathrm{P}}=0$ value of $\mathbf{5 a}$ is somewhat smaller than that ( $\nu_{\mathrm{P}=\mathrm{O}}=1178 \mathrm{~cm}^{-1}$ ) of a similar trimethylene-fused 2,5diphenylphosphole $P$-oxide [14]. ${ }^{4}$

The crystal structure of $\mathbf{5 b}$ was elucidated by X-ray crystallography. The ORTEP diagram is shown in Fig. 1 with selected bond lengths and bond angles. The phosphorus center forms a tetrahedral geometry with average C-P-C and C-P-O angles of $101.9^{\circ}$ and $116.4^{\circ}$, respectively. The

Selected bond lengths ( $\AA$ ) and angles (deg): C(1)-C(2), 1.375(2); C(2)$C(3), 1.411(2) ; C(3)-C(4), 1.387(2) ; C(4)-C(5), 1.431(2) ; C(5)-C(6)$, $1.362(2) ; \quad C(6)-C(7), \quad 1.466(2) ; \quad C(7)-C(8), \quad 1.356(2) ; \quad C(8)-C(9)$, 1.4394(19); C(9)-C(10), 1.386(2); C(10)-C(11), 1.406(2); C(11)-C(12), 1.380(2); P-C(5), 1.8116(15); P-C(8), 1.8019(15); P-C(16), 1.8061(16); P-O, 1.4871(11); C(5)-P-C(8), 94.35(7); C(5)-P-C(16), 105.41(7); C(8)-P-C(16), 105.80(7); C(5)-P-O, 120.34(7); C(8)-P-O, 116.75(7); C(16)-P0, 112.00(7).
$\mathrm{C}-\mathrm{C}$ bond length alternation of the phosphole subunit differs considerably from that of two pyrrole subunits, which reflects the difference in aromaticity between these two kinds of heterole rings. The relatively narrow dihedral angles between the central phosphole and adjacent pyrrole rings (4.7-18.3 ${ }^{\circ}$ ) indicate efficient $\pi$-conjugation through the pyrrole-phosphole-pyrrole linkage. As for the stereochemistry at the inter-ring bonds, one pyrrole ring adopts an S-trans (anti) conformation against the phosphole ring, whereas the other adopts an S-cis (syn) conformation. The $\mathrm{N}(2)-\mathrm{H}$ group of the syn pyrrole ring is directed to the $\mathrm{P}-$ oxo group with $\mathrm{N} \bullet \bullet \mathrm{O}$ distance of $3.20 \AA$, indicating that weak hydrogen-bonding interaction is present between the NH proton and the oxygen atom in $\mathbf{5 b}$ [15]. ${ }^{5}$ The $\mathrm{P}=0$ distance of $1.4871(11) \AA$ is almost identical to that [1.489(1) Å] of Tanaka's 2,5-diphenyl-1-phenylphosphole $P$-oxide [16].

### 2.2. Optical and electrochemical properties of 2,5-bis(pyrrol-2-yl)phosphole derivatives

To investigate the optical and electrochemical properties of $\alpha, \alpha^{\prime}$-free and $\alpha, \alpha^{\prime}$-phenyl-capped pyrrole-phosp-hole-pyrrole $\pi$-systems, we measured UV-vis absorption and fluorescence spectra and redox potentials of 4-6 in

${ }^{f} r$ : reversible; ir: irreversible.
${ }^{\mathrm{g}}$ Not determined.
$\mathrm{CH}_{2} \mathrm{Cl}_{2}$. The results are summarized in Table 1 and Fig. 2. In the absorption spectra, the $\alpha, \alpha^{\prime}$-free derivatives $\mathbf{4 a}, \mathbf{5 a}$, and 6a display the lowest $\pi-\pi^{*}$ transitions at $\lambda_{\mathrm{ab}} 416,458$, and 454 nm , respectively. As typically observed for phosphole derivatives, chemical functionalizations at the phosphorus center from $\sigma^{3}$ to $\sigma^{4}$ induce red-shifts of $\lambda_{\mathrm{ab}}$ values $\left(\Delta \lambda_{\mathrm{ab}}=38-42 \mathrm{~nm}\right)$. The same trend was observed for the phenyl-capped series, $\mathbf{4 b}, \mathbf{5 b}$, and $\mathbf{6 b}\left(\Delta \lambda_{\mathrm{ab}}=47-48 \mathrm{~nm}\right)$. The $\sigma^{3}$ derivatives $\mathbf{4 a , b}$ are fluorescent, whereas the $\sigma^{4}$ derivatives $\mathbf{5 a , b}$ and $\mathbf{6 a , b}$ are weakly fluorescent. Notably, 4b emits intense yellowish green fluorescence at $\lambda_{\text {em }}$ 536 nm with fluorescence quantum yield ( $\Phi_{\mathrm{f}}$ ) of 0.78 . To our knowledge, this is the highest $\Phi_{\mathrm{f}}$ value ever reported for type A 2,5-diarylphospholes. ${ }^{6}$ Nonradiative pathways from the $S_{1}$ state of $\mathbf{4 b}$ may be suppressed and/or a radiative pathway may be accelerated by the effective $\pi$ conjugation through the pyrrole-phosphole-pyrrole $\pi$ linkage. ${ }^{7}$ The absorption/emission maxima of $\mathbf{4 a}, \mathbf{5 a}$, and 6a are appreciably red-shifted compared to those of the previously reported 2,5-diarylphosphole analogs. In other words, the introduction of the pyrrolyl groups narrows HOMO-LUMO gaps of $\pi$-conjugated phospholes of type $\mathbf{A}$. For instance, the optical HOMO-LUMO gaps of the respective $\sigma^{3}-\mathrm{P}$ and $\sigma^{4}-\mathrm{P}$-oxo derivatives are 2.69 eV ( $\mathrm{Ar}=2$-pyrrolyl) vs. $2.72-3.02 \mathrm{eV}$ (2-thienyl, phenyl, 2pyridyl, measured in THF) [4d] and 2.39 eV ( $\mathrm{Ar}=2-$ pyrrolyl) vs. $2.51-2.83 \mathrm{eV}$ (2-thienyl, phenyl, measured in THF) [4b, 8b, 14].

Redox potentials of $\mathbf{4 b}, \mathbf{5 a}, \mathbf{b}$, and $\mathbf{6 a}, \mathbf{b}$ were measured by using cyclic voltammetry (CV) and differential pulse voltammetry (DPV) with $0.1 \mathrm{M} \mathrm{nBu} 4_{4} \mathrm{NPF}_{6}$ as an electro-

[^5]lyte in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ (Table 1). Although reduction processes were not observed in the measurement window ( -2.6 V to $+1.0 \mathrm{~V} \mathrm{vs} . \mathrm{Fc} / \mathrm{Fc}^{+}$), oxidation processes were observed for all compounds examined. The $\alpha, \alpha^{\prime}$-free derivatives 5a and $\mathbf{6 a}$ showed irreversible voltammograms accompanied by deposition of insoluble substances, whereas the $\alpha, \alpha^{\prime}$-phenyl-capped derivatives $\mathbf{4 b}, \mathbf{5 b}$, and $\mathbf{6 b}$ showed two reversible oxidation processes in CV measurements. In the cases of $5 \mathbf{5}$ and $\mathbf{6 a}$, subsequent chemical reactions such as an electropolymerization may occur at the $\alpha$-free pyrrole rings when electrochemically oxidized. The Pfunctionalizations (from $\mathbf{4 b}$ to $\mathbf{5 b}$ band $\mathbf{6 b}$ ) make a definite impact on the first and second oxidation processes, both of which are shifted to lower potentials by $0.16-0.22 \mathrm{~V}$. It is worthy to note that the electrochemical oxidations of 4,5 , and 6 occur at much lower potentials than those reported for related 2,5-diarylphospholes (aryl $=2$-thienyl, phenyl, 2-pyridyl). ${ }^{8}$ For instance, the difference in the first oxidation potentials between $\mathbf{5 a}$ and 2,5diphenylphosphole P -oxide [14] of the same trimethy-lene-fused type reaches 1 V . These experimental results demonstrate that the pyrrole components play a key role in fine-tuning of the redox properties, especially electrochemical oxidation properties, of type A phosphole derivatives.

To get more insight into electronic structures of the phosphole-pyrrole hybrid $\pi$-systems, we performed density functional theory (DFT) calculations on model compounds $\mathbf{4 m}$ and $\mathbf{5 m}$ in three forms, anti-anti, anti-syn, and syn-syn (Fig. 3). At the optimized structures, inter-ring torsion angles are small (10.1-21.7 ${ }^{\circ}$ ) for all models. This indicates that the effective $\pi$-conjugation is attained over the three heterole rings. There is negligible difference in relative energies of the three conformers for $\mathbf{4 m}$ ( $\Delta E<0.3 \mathrm{kcal} \mathrm{mol}^{-1}$ ), implying that all forms are equally

[^6]

Fig. 2. UV-Vis absorption and fluorescence spectra ( $\lambda_{\text {ex }}=450 \mathrm{~nm}$ ) in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ : blue, $\mathbf{4 b}$; green, $\mathbf{5 a}$; red, $\mathbf{5 b}$; black, $\mathbf{7}$; brown, trans-8. The fluorescence spectra are normalized to the corresponding absorption spectra for comparison.

Fig. 3. HOMO (lower) and LUMO (upper) of (a) $\mathbf{4 m}$ and (b) 5m: anti-anti (left), anti-syn (middle), syn-syn (right). The calculated orbital energies (in eV) are shown in parentheses.

Scheme 2.
conceivable. In contrast, anti-syn and syn-syn conformers of 5 m are more stabilized by 3.5 and $6.1 \mathrm{kcal} \mathrm{mol}^{-1}$, respectively, than anti-anti isomer. Considering the fact that the stabilization energy of the syn-syn conformer is about twice as that of the anti-syn one, the origin of this energetic stabilization is attributable mainly to the intramolecular $\mathrm{NH} \bullet \bullet \mathrm{O}=\mathrm{P}$ hydrogen-bonding interaction. Indeed, the $\mathrm{N} \bullet \bullet \bullet \mathrm{O}$ distance calculated for $\mathbf{5 m}$ (anti$\operatorname{syn})(3.067 \AA$ ) is within the range of this type of hydrogen bonds [15]. In each model, HOMO consists of conjugated polyene-derived $\pi$-networks, whereas LUMO possesses a significant character of central phosphole units. The Poxygenation from $\mathbf{4 m}$ to $\mathbf{5 m}$ lowers LUMO and HOMO levels by $0.62-0.68 \mathrm{eV}$ and $0.25-0.29 \mathrm{eV}$, respectively. Note that LUMOs are more stabilized than HOMOs for all conformers. This is a typical trend for phosphole derivatives and has been rationalized by considering effective $\sigma^{*}(\mathrm{P}-\mathrm{X})-\pi^{*}$ orbital interaction including the dienic $\pi$ systems as depicted in Fig. 3b. The LUMO levels of the Poxo models 5 m are more stabilized in the order anti-anti $(-1.93 \mathrm{eV})>$ anti-syn $\quad(-2.00 \mathrm{eV})>$ syn-syn $\quad(-2.06 \mathrm{eV})$, which displays a key contribution of the $\mathrm{NH} \bullet \bullet \bullet \mathrm{O}=\mathrm{P}$ hydrogen-bonds in the stabilization of LUMO. Timedependent DFT (TD-DFT) calculation on $\mathbf{4 m}$ in the synsyn form revealed that the lowest excitation band observed for the $\sigma^{3}$-P derivatives $\mathbf{4}$ is based on a HOMO $\rightarrow$ LUMO $\pi-$ $\pi^{*}$ transition.

### 2.3. Coordination behavior of 2,5-bis(5-phenylpyrrol-2yl)phosphole

Recently, the structure-optical property relationship of metal-bridged phosphole-containing $\pi$-systems has received growing interest [17]. ${ }^{9}$ To investigate the coordination behavior of 2,5-bis(pyrrol-2-yl)phosphole as a phosphine ligand, 4b was reacted with gold(I) and

[^7]platinum(II) salts (Scheme 2). Treatment of $\mathbf{4 b}$ with one equiv of $\mathrm{AuCl}\left(\mathrm{SMe}_{2}\right)$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at room temperature yielded AuCl-phosphine complex 7 in $80 \%$ yield. When treated with a half equiv of $\mathrm{PtCl}_{2}$ under the same conditions, $\mathrm{PtCl}_{2}$-bis(phosphine) complex 8 was formed as a trans/cis mixture (ca. 1:1). Metal complexes 7 and $\mathbf{8}$ were characterized by spectroscopy and X-ray crystallography. The ${ }^{31} \mathrm{P}$ chemical shifts of $\mathbf{7}$, trans-8, and cis-8 are $\delta_{\mathrm{P}}$ $51.4, \delta_{\mathrm{P}} 51.6\left(\mathrm{~J}_{\mathrm{P}-\mathrm{Pt}}=2244 \mathrm{~Hz}\right)$, and $\delta_{\mathrm{P}} 31.5\left(\mathrm{~J}_{\mathrm{P}-\mathrm{Pt}}=3177 \mathrm{~Hz}\right)$, respectively. The downfield appearance of the NH protons of $\mathbf{8}(\delta 9.73-9.79)$ relative to those of $7(\delta 8.48)$ suggests that the pyrrolic NH groups spatially interact with the chlorine atoms in $\mathbf{8}$ (vide infra). High-resolution mass spectra of $\mathbf{7}$ and trans-8 showed respective parent ion peaks ( $\mathrm{M}^{+}$) at $\mathrm{m} / \mathrm{z} 714.1267$ (calcd. 714.1266) and $\mathrm{m} / \mathrm{z}$ 1229.2854 (calcd. 1229.2849).

The crystal structures of 7 and trans-8 were successfully determined by X-ray crystallography. The ORTEP diagrams are shown in Figs. 4 and 5 with selected bond lengths and bond angles. In each complex, the phosphorus center forms a tetrahedral geometry with average C-P-C and C-P-M angles of $101.9-103.3^{\circ}$ and 115.2-114.7 ${ }^{\circ}$, respectively. The $\mathrm{C}-\mathrm{P}-\mathrm{C}$ bond angles of $\mathbf{7}$ and $\mathbf{8}$ are almost identical to those of $\mathbf{5 b}$. In complex $\mathbf{7}$, the gold(I) center adopts a linear geometry with $\mathrm{P}-\mathrm{Au}-\mathrm{Cl}$ bond angle of 176.53(8) ${ }^{\circ}$, and both the pyrrole rings adopt anti-anti conformation against the phosphole ring with small dihedral angles between the two adjacent heterole rings (6.2-9.9 ${ }^{\circ}$. Judging from the packing structure, neither intramolecular nor intermolecular interaction between the pyrrolic NH protons and the chlorine atoms is present in 7.

In trans-8, the platinum(II) atom is the center of $C_{i}$ symmetry and forms a square planar geometry ( $\Sigma_{\text {P-Pt-Cl }}$ $=180^{\circ}$ ). As shown in Fig. 5a, the Pt-P coordination bonds link two pyrrole-phosphole-pyrrole $\pi$-planes as slipped, parallel fashion, and each $\pi$ system adopts anti-syn conformation with dihedral angles between the two adjacent heterole rings of $12.9-19.5^{\circ}$. Note that the syn
(a)

Fig. 4. Top view (upper) and side view (lower) of 7 (30\% probability ellipsoids). Hydrogen atoms except for NH are omitted for clarity. Selected bond lengths ( $\AA$ ) and angles (deg): C(1)-C(2), 1.383(10); C(2)$C(3), 1.403(10) ; C(3)-C(4), 1.377(10) ; C(4)-C(5), 1.439(9) ; C(5)-C(6)$, $1.365(9) ; \quad C(6)-C(7), \quad 1.458(10) ; \quad C(7)-C(8), \quad 1.351(10) ; \quad C(8)-C(9)$, 1.426(10); C(9)-C(10), 1.380(10); C(10)-C(11), 1.394(11); C(11)-C(12), 1.371(10); P-C(5), 1.801(7); P-C(8), 1.820(7); P-C(16), 1.802(7); P-Au, 2.2302(18); Au-Cl, 2.276(2); C(5)-P-C(8), 94.6(3); C(5)-P-C(16), 109.1(3); C(8)-P-C(16), 105.6(3); C(5)-P-Au, 113.1(2); C(8)-P-Au, 119.1(2); C(16)-P-Au, 113.4(2); P-Au-Cl, 176.53(8).
pyrrole rings direct their NH groups toward the chlorine atoms bound to platinum with an intramolecular $\mathrm{N} \bullet \bullet \mathrm{Cl}$ distance of $3.31 \AA$ [18], ${ }^{10}$ indicating there exists cooperative hydrogen-bonding interaction between the NH protons and the chlorine atoms. Such a coordinating property cannot be produced by other conventional aryl substituents and shows the characteristic structural features of the pyrrole ligands. A relatively short distance (ca. $3.3 \AA$ ) between the center of anti-pyrrole ring and the nearest ortho-proton of the facing $\alpha$-phenyl group implies that weak $\mathrm{CH} \bullet \bullet \bullet \pi$ interaction is also present at least in the solid state.

### 2.4. Optical properties of metal complexes of 2,5-bis(1-phenylpyrrol-2-yl)phosphole

Finally, we measured absorption and fluorescence spectra of the metal complexes, 7 and trans-8. ${ }^{11}$ Fig. 2 clearly displays that these two complexes show different optical properties. The AuCl complexation (from 4b to 7)

[^8]

Fig. 5. Top view (upper) and side view (lower) of 8 (30\% probability ellipsoids). Hydrogen atoms except for NH are omitted for clarity. Selected bond lengths ( $\AA$ ) and angles (deg): C(1)-C(2), 1.368(8); C(2)C(3), 1.406(8); C(3)-C(4), 1.389(8); C(4)-C(5), 1.442(7); C(5)-C(6), 1.360(7); C(6)-C(7), 1.442(7); C(7)-C(8), 1.357(7); C(8)-C(9), 1.454(7); C(9)-C(10), 1.387(8); C(10)-C(11), 1.417(8); C(11)-C(12), 1.374(9); PC(5), 1.827(5); P-C(8), 1.814(5); P-C(16), 1.827(5); P-Pt, 2.3315(16); PtCl, 2.3105(15); C(5)-P-C(8), 93.4(2); C(5)-P-C(16), 107.8(2); C(8)-PC(16), 109.3(2); C(5)-P-Pt, 112.78(17); C(8)-P-Pt, 114.34(17); C(16)-PPt, 116.75(18); $\mathrm{P}-\mathrm{Pt}-\mathrm{Cl}(1), 88.68(5) ; \mathrm{P}-\mathrm{Pt}-\mathrm{Cl}(1 \mathrm{a}), 91.32(5)$.
induces red-shifts of the absorption and fluorescence $\operatorname{maxima}\left(\Delta \lambda_{\mathrm{ab}}=45 \mathrm{~nm} ; \Delta \lambda_{\mathrm{em}}=70 \mathrm{~nm}\right)$ and decreases of $\Phi_{\mathrm{f}}$ value (from 0.78 to 0.09 ) and fluorescence lifetime (from 3.50 ns to 1.54 ns ). A small difference in the observed Stokes shift ( $\Delta \lambda$ ) between $7\left(\Delta \lambda=3.34 \times 10^{3} \mathrm{~cm}^{-1}\right)$ and $\mathbf{4 b}$ ( $\Delta \lambda=3.13 \times 10^{3} \mathrm{~cm}^{-1}$ ) may suggest that the attachment of the AuCl moiety does not affect the intrinsic character of the $\mathrm{HOMO} \rightarrow$ LUMO transition significantly. In sharp contrast, the $\mathrm{PtCl}_{2}$ complexation (from $\mathbf{4 b}$ to trans-8) varies optical properties of the free phosphine ligand dramatically. In the absorption spectrum of trans-8, two separated, broad bands were observed at $\lambda_{\mathrm{ab}} 450$ and 533 nm with similar intensity. The high-energy band is slightly blue-shifted ( $\Delta \lambda_{\mathrm{ab}}=-9 \mathrm{~nm}$ ) relative to $\lambda_{\mathrm{ab}}$ of $\mathbf{4 b}$ ( 459 nm ), whereas the low-energy band is largely redshifted $\left(\Delta \lambda_{\mathrm{ab}}=74 \mathrm{~nm}\right)$. It is likely that two slipped, parallel $\pi$-planes with $C_{i}$ symmetry linked by the $\mathrm{Pt}-\mathrm{P}$ and $\mathrm{NH} \bullet \bullet \bullet \mathrm{Cl}$ bonds play a crucial role in the unusual splitting observed for trans-8. No fluorescence was observed for trans-8.

Fig. 6. Frontier orbitals of $\mathbf{7 m}$ and $\mathbf{8 m}$. The calculated orbital energies (in eV ) are shown in parentheses.

Table 2
Excitation energies and oscillator strengths of $\mathbf{4 m}$ (syn-syn), $\mathbf{7 m}$, and $\mathbf{8 m}$ calculated by the TD-B3LYP method ${ }^{\text {a }}$.

| State | Excitation energy |  | Oscillator strength | Excitation | Weight (\%) |
| :---: | :---: | :---: | :---: | :---: | :---: |
|  | (eV) | ( nm ) |  |  |  |
| 4m (syn-syn) |  |  |  |  |  |
| $1^{1} \mathrm{~A}^{\prime \prime}$ | 2.95 | 420 | 0.5865 | HOMO $\rightarrow$ LUMO | 38 |
| 7m |  |  |  |  |  |
| $1^{1} \mathrm{~A}^{\prime \prime}$ | 2.56 | 484 | 0.4590 | HOMO $\rightarrow$ LUMO | 38 |
| 8m |  |  |  |  |  |
| $2^{1} \mathrm{~A}_{u}$ | 2.64 | 470 | 0.2346 | HOMO - $1 \rightarrow$ LUMO + 1 | 39 |
| $3{ }^{1} \mathrm{~A}_{u}$ | 2.95 | 420 | 0.6290 | HOMO $\rightarrow$ LUMO + 2 | 38 |

${ }^{\text {a }}$ The states whose oscillator strengths are less than 0.2 are not included.

To get a deep insight into the character of the observed absorption bands, we performed TD-DFT calculations on models of $\mathrm{Au}^{\mathrm{I}}$ and trans- $\mathrm{Pt}^{\mathrm{II}}$ complexes (Fig. 6 and Table 2). The structures of $\mathbf{7 m}$ and $\mathbf{8 m}$, where all the phenyl substituents were replaced by hydrogens, were optimized starting from the X-ray geometries observed for 7 and trans-8. As shown in Fig. 6a, HOMO and LUMO of 7 m basically maintain the character of the respective orbitals of $\mathbf{4 m}$ (anti-anti) except for their relative energies; LUMO is more stabilized than HOMO by the AuCl complexation. The TD-DFT result of $\mathbf{7 m}$ (Table 2) implies that the intense absorption band observed for 7 is based on HOMO$\rightarrow$ LUMO excitation. Fig. 6b shows five frontier orbitals of 8m, HOMO - 1, HOMO, LUMO, LUMO + 1, and LUMO + 2, with their orbital energies. Obviously, HOMO and

HOMO - 1, which are constructed by two original HOMOs of the free base, do not interact with each other. As a consequence, HOMO and HOMO - 1 have almost the same energies. On the other hand, LUMO and LUMO +2 consist of the metal-derived $d$ orbitals and the ligand-derived $\pi^{*}$ orbitals. Importantly, the coordination to the platinum(II) center induces a significant split of the original LUMOs of the symmetrical $\pi$-conjugated ligands probably due to $\sigma^{*}(\mathrm{M}-\mathrm{P})-\pi^{*}$ orbital interaction. The TD-DFT results of $\mathbf{8 m}$ revealed that the two absorption bands observed for trans8 are attributable mainly to $\mathrm{HOMO} \rightarrow$ LUMO $+2(2.95 \mathrm{eV})$ and $\mathrm{HOMO}-1 \rightarrow \mathrm{LUMO}+1(2.64 \mathrm{eV})$ excitations. The finding that the lowest excitation state (HOMO $\rightarrow$ LUMO) is not the high-intensity transition for $\mathbf{8 m}$ (oscillator strength is less than 0.1 ) may also explain the nonfluores-
cent property of the Pt complex $\mathbf{8}$. These results show that the metal complexation is a promising approach to make a large impact on the optical properties of 2,5-bis(pyrrol-2$\mathrm{yl})$ phosphole derivatives.

In summary, we established a convenient method for the synthesis of new $\pi$-conjugated phospholes bearing two pyrrole substituents, and revealed their optical, electrochemical, and coordinating properties. The flat $\pi$-planes, low excitation energies, and small oxidation potentials observed for the $\sigma^{3}-\mathrm{P}$ and $\sigma^{4}-\mathrm{P}$ derivatives represent the efficient $\pi$-conjugation through the pyrrole-phospholepyrrole linkage as well as electron excessive nature of the pyrrole subunits. It is also noteworthy that the gold(I) and platinum(II) complexes coordinated by the phenyl-capped $\sigma^{3}-\mathrm{P}$ derivative exhibit quite different structural and optical properties. It is of particular interest that trans-$\mathrm{Pt}^{\mathrm{II}}$-bisphosphine complex contains slipped, parallel $\pi$ planes linked by the Pt-P bonds and the $\mathrm{NH}-\mathrm{Cl}$ hydrogen bonds. This cooperative interaction gives rise to split $\pi-\pi^{*}$ transitions at the long-wavelength region, which can be rationalized by considering the orbital interaction between the $\mathrm{Pt}-\mathrm{X}$ bonds and the hybrid $\pi$-systems. The combination of phosphole and pyrrole has great synthetic potential, since these functionalizable heteroles are readily subject to new $\pi$-framework construction. Further studies on materials chemistry of phosphole-pyrrole $\pi$-conjugated systems are now in progress.

## 3. Experimental section

${ }^{1} \mathrm{H},{ }^{13} \mathrm{C}$, and ${ }^{31} \mathrm{P}$ NMR spectra were recorded on a JEOL JNM-EX400 spectrometer using $\mathrm{CDCl}_{3}$ or $\mathrm{CD}_{2} \mathrm{Cl}_{2}$. Chemical shifts are reported in ppm as relative values vs. tetramethylsilane (internal reference for ${ }^{1} \mathrm{H}$ and ${ }^{13} \mathrm{C}$ ) and phosphoric acid (external reference for ${ }^{31} \mathrm{P}$ ). Matrixassisted laser desorption/ionization (MALDI) time-of-flight mass spectra (TOF) were measured on a SHIMADZU Biotech AXIMA-CFR spectrometer using 1,8-dihydroxy$9(10 \mathrm{H})$-anthracenone (dithranol) as a matrix. High-resolution mass spectra (HRMS) were obtained on a JEOL JMSHS110 spectrometer using 3-nitrobenzyl alcohol as a matrix. IR spectra were recorded on a JASCO FT/IR-470 Plus spectrometer using KBr pellets. UV-vis absorption spectra were measured on a PerkinElmer Lambda 900 UV/vis/NIR spectrometer. Steady-state fluorescence spectra were recorded with a SPEX Fluoromax-3 spectrofluorometer (HORIBA). Electrochemical measurements were made with an ALS 630a electrochemical analyzer using a glassy carbon working electrode, a platinum wire counter electrode, and an $\mathrm{Ag} / \mathrm{Ag}^{+}\left[0.01 \mathrm{M} \mathrm{AgNO}_{3}, 0.1 \mathrm{M} n \mathrm{Bu}_{4} \mathrm{NPF}_{6}\right.$ ( MeCN )] reference electrode. The potentials were calibrated with ferrocene/ferrocenium $\left[E_{\text {mid }}=+0.20 \mathrm{~V}\right.$ vs. $\left.\mathrm{Ag} / \mathrm{Ag}^{+}\right]$. 1-Boc-2-iodopyrrole (1a) [12] and 1-Boc-2-iodo-5-phenylpyrrole (1b) [13] were prepared according to the reported procedures.

The solvents used for the reactions were distilled from sodium benzophenone ketyl (THF and $\mathrm{Et}_{2} \mathrm{O}$ ) or calcium hydride $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ under inert atmosphere before use. Other chemicals and solvents were of reagent grade quality, purchased commercially and used without further purification. Thin-layer chromatography and flash column
chromatography were performed with Alt. 5554 DCAlufolien Kieselgel $60 \mathrm{~F}_{254}$ (Merck) and Silica-gel 60N (Kanto Chemicals), respectively. All the reactions were performed under an argon atmosphere unless otherwise noted.

### 3.1. Synthesis of $2 a, b$

A mixture of 1a ( $3.58 \mathrm{~g}, 12.2 \mathrm{mmol}$ ), CuI ( 212 mg , $1.11 \mathrm{mmol}), \mathrm{PdCl}_{2}\left(\mathrm{PPh}_{3}\right)_{2}(390 \mathrm{mg}, 0.55 \mathrm{mmol}), 1,6$-heptadiyne ( $0.64 \mathrm{~mL}, 5.6 \mathrm{mmol}$ ), triethylamine ( 12 mL ), and $1,4-$ dioxane ( 8 mL ) was stirred at room temperature. After 24 h , the reaction mixture was filtrated through a Celite bed, and the filtrates were concentrated under reduced pressure. The oily residue was subjected onto alumina column chromatography (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}=1 / 1$ ) to give 2a as a pale brown oil ( $\left.R_{\mathrm{f}}=0.2,2.0 \mathrm{~g}, 85 \%\right) .{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, 300 MHz ): $\delta 1.60(\mathrm{~s}, 18 \mathrm{H}, t-\mathrm{Bu}), 1.91$ (quint, $2 \mathrm{H}, J=7.0 \mathrm{~Hz}$, $\mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), $2.62\left(\mathrm{t}, 4 \mathrm{H}, J=7.0 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 6.11$ (pseudo $\mathrm{t}, 2 \mathrm{H}, J=3.3 \mathrm{~Hz}$ pyrrole- $\beta$ ), $6.43(\mathrm{~m}, 2 \mathrm{H}$, pyrrole$\beta$ ), 7.21 ( $\mathrm{m}, 2 \mathrm{H}$, pyrrole- $\alpha$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right)$ : $\delta$ 18.8, 27.6, 27.7, 73.1, 83.6, 92.4, 110.5, 115.5, 119.7, 121.5, 148.2; HRMS (EI) Calculated for $\mathrm{C}_{25} \mathrm{H}_{30} \mathrm{~N}_{2} \mathrm{O}_{4}\left(\mathrm{M}^{+}\right)$: 422.2206. Found: $m / z 422.2203$.

According to a similar procedure, compound 2b was prepared from 1b and 1,6-heptadiyne. Yield $81 \%$. Pale brown oil. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 1.34(\mathrm{~s}, 18 \mathrm{H}, \mathrm{t}$ - Bu$)$, 1.94 (quint, $2 \mathrm{H}, J=6.8 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.67 (t, 4 H , $\left.J=6.8 \mathrm{~Hz}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 6.13(\mathrm{~d}, 2 \mathrm{H}, J=3.4 \mathrm{~Hz}$, pyrrole- $\beta$ ), 6.45 (d, $2 \mathrm{H}, J=3.4 \mathrm{~Hz}$, pyrrole- $\beta$ ), $7.26-7.38(\mathrm{~m}, 10 \mathrm{H}, \mathrm{Ph})$; ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta 18.9,27.17,27.20,27.7$, 27.8, 73.0, 83.8, 93.1, 112.4, 117.4, 117.7, 127.0, 127.7, 128.1, 133.9, 135.6, 148.7; MS (EI): m/z 374 ([M - 2Boc $]^{+}$).

### 3.2. Synthesis of $3 a, b$

To a mixture of $\mathbf{2 a}(6.3 \mathrm{~g}, 15 \mathrm{mmol}), \mathrm{Ti}(\mathrm{Oi}-\mathrm{Pr})_{4}(4.4 \mathrm{~mL}$, $15 \mathrm{mmol})$, and $\mathrm{Et}_{2} \mathrm{O}(210 \mathrm{~mL})$ was slowly added an ether solution of $i-\mathrm{PrMgCl}(2.0 \mathrm{M} \times 15 \mathrm{~mL}, 30 \mathrm{mmol})$ at $-78^{\circ} \mathrm{C}$, and the resulting mixture was stirred for 2 h at $-50^{\circ} \mathrm{C}$. Dichloro(phenyl)phosphine ( $2.0 \mathrm{~mL}, 15 \mathrm{mmol}$ ) was then added to the mixture at this temperature, and the resulting suspension was allowed to warm to $0^{\circ} \mathrm{C}$ and stirred for 1 h at this temperature. After stirring for an additional 2 h at room temperature, a saturated aq $\mathrm{NH}_{4} \mathrm{Cl}$ solution was poured into the reaction mixture, and insoluble substances were filtrated off through a Celite bed. The Celite bed was washed with AcOEt repeatedly, and the filtrate was washed with brine. The aqueous phase was extracted with AcOEt, and the combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated under reduced pressure. The oily residue was subjected onto alumina column chromatography (hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}=2 / 1$ ). The yellow fraction ( $R_{\mathrm{f}}=0.4$ ) was collected and evaporated to give a yellow solid ( $3.4 \mathrm{~g}, 43 \%$ ). Mp $46-47{ }^{\circ} \mathrm{C} ;{ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}, 400 \mathrm{MHz}$ ): $\delta 1.52(\mathrm{~s}, 18 \mathrm{H}, t-\mathrm{Bu}), 2.13-2.22\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.31-$ 2.43 ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.50-2.69 ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 5.95 (broad s, 2H, pyrrole- $\beta$ ), 6.07 (pseudo t, $2 \mathrm{H}, \mathrm{J}=3.4 \mathrm{~Hz}$, pyrrole- $\beta$ ), 7.22-7.25 (m, 2H, pyrrole- $\alpha$ ), 7.15-7.25 (m, 3H, P-Ph-m,p), $7.34-7.40(\mathrm{~m}, 2 \mathrm{H}, \mathrm{P}-\mathrm{Ph}-o) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right.$, 100 MHz ): $\delta 27.9,28.8,29.0,83.2,110.6,114.6\left(\mathrm{~d}, \mathrm{~J}_{\mathrm{P}}\right.$
$\mathrm{c}=6.6 \mathrm{~Hz}), 122.5,128.1\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=7.4 \mathrm{~Hz}\right), 128.7,129.1$, $129.7\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=24.0 \mathrm{~Hz}\right), 133.0\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=15.7 \mathrm{~Hz}\right), 133.5(\mathrm{~d}$, $\left.J_{\mathrm{P}-\mathrm{C}}=19.0 \mathrm{~Hz}\right), 149.2,155.5\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=11.6 \mathrm{~Hz}\right) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}$ $\left(\mathrm{CDCl}_{3}, 162 \mathrm{MHz}\right): \delta+45.9$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\varepsilon)$ 371 nm (10600); HRMS (FAB) calculated for $\mathrm{C}_{31} \mathrm{H}_{35} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{P}$ $\left(\mathrm{M}^{+}\right): 530.2334$. Found: $m / z 530.2353$.

According to a similar procedure, compound $\mathbf{3 b}$ was prepared from 2b. However, 3b could not be purified completely, as the remaining $\mathbf{2 b}$ was difficult to separate from the crude product. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 400 \mathrm{MHz}\right): \delta 1.21$ ( $\mathrm{s}, 18 \mathrm{H}, t-\mathrm{Bu}$ ), 2.17-2.27 (m, $2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.38-2.50 ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), $2.68-2.80\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 6.01-$ 6.13 (m, 4H, pyrrole- $\beta$ ), $7.20-7.40(\mathrm{~m}, 15 \mathrm{H}, \mathrm{Ph}) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\mathrm{CDCl}_{3}, 162 \mathrm{MHz}$ ): $\delta+45.6$; HRMS (FAB) calculated for $\mathrm{C}_{43} \mathrm{H}_{43} \mathrm{~N}_{2} \mathrm{O}_{4} \mathrm{P}\left(\mathrm{M}^{+}\right)$: 682.2960. Found: $m / z 682.2989$.

### 3.3. Synthesis of $4 a, b$

To a THF solution ( 1.5 mL ) of 3a ( $100 \mathrm{mg}, 0.188 \mathrm{mmol}$ ) was added a MeOH solution ( 3 mL ) of NaOMe ( 102 mg , 1.88 mmol ) at room temperature. After stirring at $70^{\circ} \mathrm{C}$ for 16 h , water ( 10 mL ) and diethyl ether ( 10 mL ) were added. The aqueous phase was extracted with diethyl ether and the combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removal of solvents under reduced pressure, the resulting mixture was subjected to alumina column chromatography (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}=2 / 1$ to $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ acetone $=6 / 1$ ). The yellow fraction ( $R_{\mathrm{f}}=0.5$; hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}=2 / 1$ ) was collected, evaporated, and reprepicipated from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane to give $\mathbf{4 a}$ ( $47 \mathrm{mg}, 76 \%$ ) as a brownish red solid. ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): ~ \delta 2.33-2.49$ ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), $2.63-2.72\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.78-$ 2.87 ( $\mathrm{m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 6.17-6.18 (m, 4H, pyrrole- $\beta$ ), 6.65-6.66 (m, 2H, pyrrole- $\alpha$ ), 7.26-7.34 (m, 3H, P-Ph-m, ), 7.53-7.57 (m, 2H, P-Ph-o), 8.01 (broad s, $2 \mathrm{H}, \mathrm{NH}$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\left.\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta 28.6,29.2,107.3\left(\mathrm{~d}, \mathrm{~J}_{\mathrm{P}-\mathrm{C}}=5.0 \mathrm{~Hz}\right)$, $109.8,118.1,125.7,129.1$ ( $\mathrm{d}, J_{\mathrm{P}-\mathrm{C}}=7.4 \mathrm{~Hz}$ ), 129.5 (d, $J_{\mathrm{P}-}$ $\mathrm{C}=22.3 \mathrm{~Hz}), 130.0,133.3\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=14.1 \mathrm{~Hz}\right), 133.6\left(\mathrm{~d}, J_{\mathrm{P}-}\right.$ $\mathrm{c}=19.8 \mathrm{~Hz}), 150.7\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{c}}=8.3 \mathrm{~Hz}\right) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CDCl}_{3}\right.$, 162 MHz ): $\delta+28.1$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}: 416 \mathrm{~nm}$; HRMS (EI) calcd for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{P}\left(\mathrm{M}^{+}\right)$: 330.1286. Found: $\mathrm{m} / \mathrm{z}$ 330.1292.

According to a similar procedure, compound $\mathbf{4 b}$ was prepared from 3b. Yield: 28\% (based on 2b). Red solid. Mp $194-195{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CD}_{2} \mathrm{Cl}_{2}, 400 \mathrm{MHz}$ ): $\delta 2.40-2.55(\mathrm{~m}$, $2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.70-2.80 (m, $2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.85$2.94\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right.$ ), 6.25 (pseudo $\mathrm{t}, 2 \mathrm{H}, \mathrm{J}=2.9 \mathrm{~Hz}$, pyrrole- $\beta$ ), 6.47 (pseudo $\mathrm{t}, 2 \mathrm{H}, J=2.9 \mathrm{~Hz}$, pyrrole- $\beta$ ), $7.15-$ 7.19 (m, 2H, P-Ph-m), 7.31-7.37 (m, 11H, Ph), 7.61-7.65 (m, 2H, P-Ph-o), 8.26 (broad s, $2 \mathrm{H}, \mathrm{NH}$ ); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 75 \mathrm{MHz}\right): \delta 28.6,29.1,107.8,109.6\left(\mathrm{~d}, J_{\mathrm{P}-}\right.$ $\mathrm{c}=5.6 \mathrm{~Hz}), 118.2,123.2,125.5,126.0,128.8,129.2(\mathrm{~d}$, $\left.J_{\mathrm{P}-\mathrm{C}}=8.1 \mathrm{~Hz}\right), 130.2 \quad\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=1.9 \mathrm{~Hz}\right), 130.7 \quad\left(\mathrm{~d}, J_{\mathrm{P}-}\right.$ $\mathrm{C}=22.3 \mathrm{~Hz}), 132.02,132.05,133.4\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=14.3 \mathrm{~Hz}\right)$, $133.5\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=19.8 \mathrm{~Hz}\right), 151.1\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=9.3 \mathrm{~Hz}\right)$, One of the carbon atoms could not be detected clearly; ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR ( $\mathrm{CD}_{2} \mathrm{Cl}_{2}, 162 \mathrm{MHz}$ ): $\delta+28.5$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}$ (ع) 330 (15200), 459 nm (34400); HRMS (EI) calcd for $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{~N}_{2} \mathrm{P}\left(\mathrm{M}^{+}\right): 482.1912$. Found: $m / z$ 482.1905. Anal. calculated for $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{~N}_{2} \mathrm{P}: \mathrm{C}, 82.14 ; \mathrm{H}, 5.64 ; \mathrm{N}, 5.81$. Found: C, 81.88; H, 5.63; N, 5.75.

### 3.4. Synthesis of $5 a, b$

To a THF solution ( 1.5 mL ) of $\mathbf{3 a}(71.5 \mathrm{mg}, 0.135 \mathrm{mmol})$ was added $\mathrm{MeOH}(3 \mathrm{~mL})$ solution of $\mathrm{NaOMe}(72.8 \mathrm{mg}$, 1.35 mmol ) at room temperature. After stirring at $70^{\circ} \mathrm{C}$ for 16 h , water ( 10 mL ) and diethyl ether ( 10 mL ) were added. The aqueous phase was extracted with diethyl ether and the combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$ and evaporated under reduced pressure. The residue was subjected onto alumina column chromatography (hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}=2 / 1$ to $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /acetone $=6 / 1$ ). The yellow fraction ( $R_{\mathrm{f}}=0.4$; hexane $/ \mathrm{CH}_{2} \mathrm{Cl}_{2}=2 / 1$ ) was collected. After removal of solvents under reduced pressure, the resulting mixture was resolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. To the resulting solution was added hydrogen peroxide ( $30 \%$ solution in $\mathrm{H}_{2} \mathrm{O}$, 0.1 mL ). After stirring 1 h , the mixture was concentrated under reduced pressure, and the solid residue was washed with diethyl ether to give $\mathbf{5 a}$ as a red solid ( $37.1 \mathrm{mg}, 79 \%$ ). Mp $255{ }^{\circ} \mathrm{C}(\mathrm{dec}) ;{ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 2.00-2.10$ ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.28-2.40 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.66$2.80\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.81-2.90\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$, 6.25 (s, 2H, pyrrole- $\beta$ ), 6.32 (s, 2H, pyrrole- $\beta$ ), $6.80(\mathrm{~s}, 2 \mathrm{H}$, pyrrole- $\alpha$ ), 7.30-7.45 (m, 3H, P-Ph-m,p), 7.65-7.78 (m, 2H, P-Ph-o), 9.09 (broad $\mathrm{s}, 2 \mathrm{H}, \mathrm{NH}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}\right.$, $100 \mathrm{MHz}): \delta 25.8,29.3\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=11.6 \mathrm{~Hz}\right), 109.2\left(\mathrm{~d}, J_{\mathrm{P}-}\right.$ $\mathrm{c}=7.4 \mathrm{~Hz}$ ), 110.1, 116.0, 117.0, 119.9, 126.2 (d, $\mathrm{J}_{\mathrm{P}-}$ $\mathrm{c}=11.6 \mathrm{~Hz}), \quad 128.9 \quad\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=12.4 \mathrm{~Hz}\right), 130.4 \quad\left(\mathrm{~d}, J_{\mathrm{P}-}\right.$ $\mathrm{c}=10.7 \mathrm{~Hz}), \quad 132.1 \quad\left(\mathrm{~d}, \quad J_{\mathrm{P}-\mathrm{C}}=3.3 \mathrm{~Hz}\right), 149.6 \quad\left(\mathrm{~d}, \quad J_{\mathrm{P}-}\right.$ $\mathrm{c}=24.8 \mathrm{~Hz}) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 162 \mathrm{MHz}\right): \delta+54.3$; IR $(\mathrm{KBr}): \nu=1165(\mathrm{P}=\mathrm{O}) \mathrm{cm}^{-1}$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\varepsilon)$ 458 nm (16700); HRMS (EI) calculated for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{OP}$ $\left(\mathrm{M}^{+}\right)$: 346.1235; Found: $m / z 346.1241$.

### 3.5. Synthesis of $6 a, b$

To a THF solution ( 3 mL ) of $\mathbf{4 a}(198 \mathrm{mg}, 0.373 \mathrm{mmol})$ was added MeOH solution ( 6 mL ) of NaOMe ( 204 mg , 3.77 mmol ) at room temperature. After stirring at $70^{\circ} \mathrm{C}$ for 16 h , water ( 10 mL ) and diethyl ether ( 10 mL ) were added. The aqueous phase was extracted with diethyl ether and the combined organic extracts were dried over $\mathrm{Na}_{2} \mathrm{SO}_{4}$. After removal of solvents under reduced pressure, the resulting mixture was resolved in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$. To the resulting solution was added elemental sulfur ( $60.3 \mathrm{mg}, 1.88 \mathrm{mmol}$ ). After stirring 3 h , the mixture was concentrated under
reduced pressure, and the solid residue was subjected to alumina column chromatography (hexane/ $\mathrm{CH}_{2} \mathrm{Cl}_{2}=2 / 1$ ). The orange fraction ( $R_{\mathrm{f}}=0.2$ ) was collected, evaporated, and reprecipitated from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ /hexane to give $\mathbf{6 a}$ as an orange solid ( $117 \mathrm{mg}, 86 \%$ ). Mp $220^{\circ} \mathrm{C}$ (dec); ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CDCl}_{3}, 400 \mathrm{MHz}\right): \delta 2.13-2.25\left(\mathrm{~m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.33-$ 2.47 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), $3.20-3.40\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right.$ ), 6.21-6.23 ( $\mathrm{m}, 2 \mathrm{H}$, pyrrole- $\beta$ ), 6.30 ( $\mathrm{s}, 2 \mathrm{H}$, pyrrole- $\beta$ ), 6.766.78 (m, 2H, pyrrole- $\alpha$ ), 7.33-7.44 (m, 3H, P-Ph-m,p), 7.847.90 (m, 2H, P-Ph-o), 9.61 (broad s, 2H, NH); ${ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta 26.9,29.3\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=10.7 \mathrm{~Hz}\right), 109.7(\mathrm{~d}$, $J_{\mathrm{P}-\mathrm{C}}=8.3 \mathrm{~Hz}$ ), 109.8, 117.8, 118.6, 119.6, 126.3 (d, $J_{\mathrm{P}-}$ $\mathrm{c}=12.4 \mathrm{~Hz}), 128.9\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=12.4 \mathrm{~Hz}\right), 130.2\left(\mathrm{~d}, J_{\mathrm{P}-}\right.$ $\mathrm{c}=11.6 \mathrm{~Hz}), \quad 132.0\left(\mathrm{~d}, \quad J_{\mathrm{P}-\mathrm{C}}=3.3 \mathrm{~Hz}\right), 151.0 \quad(\mathrm{~d}, J \quad \mathrm{P}-$ $\mathrm{c}=22.3 \mathrm{~Hz}) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 162 \mathrm{MHz}\right): \delta+63.4$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\varepsilon) 454 \mathrm{~nm}(17,500)$; HRMS (EI) calculated for $\mathrm{C}_{21} \mathrm{H}_{19} \mathrm{~N}_{2} \mathrm{PS}\left(\mathrm{M}^{+}\right)$: 362.1007; Found: $\mathrm{m} / \mathrm{z}$ 362.1011 .

According to a similar procedure, compound $\mathbf{6 b}$ was prepared from $\mathbf{4 b}$ and elemental sulfur. Yield, $82 \%$. Brown solid. Mp $286{ }^{\circ} \mathrm{C}$ (dec); ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CD}_{2} \mathrm{Cl}_{2}, 400 \mathrm{MHz}\right): \delta 2.20-$ 2.35 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.35-2.52 ( $\mathrm{m}, 1 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 2.75-2.90 (m, 4H, CH2CH2CH $)$, 6.41 (s, 2 H , pyrrole- $\beta$ ), 6.57 (s, 2H, pyrrole- $\beta$ ), 7.20-7.25 (m, 2H, P-Ph-m), 7.30-7.52 (m, 11H, Ph ), 7.90-8.05 (m, 2H, P-Ph-o), 9.96 (broad s, 2H, $\mathrm{NH}) ;{ }^{13} \mathrm{C}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CDCl}_{3}, 100 \mathrm{MHz}\right): \delta 27.0,29.4\left(\mathrm{~d}, \mathrm{~J}_{\mathrm{P}}\right.$ $\mathrm{c}=11.6 \mathrm{~Hz}), 107.7,111.7\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=8.3 \mathrm{~Hz}\right), 117.4,118.2$, 123.8, 126.6, 127.6 (d, $J_{\text {P-C }}=12.4 \mathrm{~Hz}$ ), 128.9, 129.0, 129.1 $\left(\mathrm{d}, J_{\mathrm{P}-\mathrm{C}}=12.4 \mathrm{~Hz}\right), 130.2\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=11.6 \mathrm{~Hz}\right), 131.8,132.1(\mathrm{~d}$, $\left.J_{\mathrm{P}-\mathrm{C}}=3.3 \mathrm{~Hz}\right), 133.6,151.3\left(\mathrm{~d}, J_{\mathrm{P}-\mathrm{C}}=21.5 \mathrm{~Hz}\right)$, Two of the carbon atoms could not be detected clearly; ${ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 162 \mathrm{MHz}\right): \delta+63.6$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\varepsilon) 320$ (20300), 507 nm (22700); HRMS (EI) calculated for $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{~N}_{2} \mathrm{PS}\left(\mathrm{M}^{+}\right): m / z$ 514.1633; Found: $m / z$ 514.1630.

### 3.6. Synthesis of 7

A mixture of $\mathbf{4 b}(10 \mathrm{mg}, 0.021 \mathrm{mmol}), \mathrm{AuCl} \bullet \mathrm{SMe}_{2}$ ( $6.1 \mathrm{mg}, 0.021 \mathrm{mmol}$ ), and $\mathrm{CH}_{2} \mathrm{Cl}_{2}(1 \mathrm{~mL})$ was stirred for 30 min at room temperature. The mixture was then concentrated under reduced pressure and subjected to silica gel column chromatography $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$. The red fraction ( $R_{\mathrm{f}}=0.7$ ) was collected, evaporated, and reprecipitated from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane to give $\mathbf{7}$ as a dark brown solid ( $12.0 \mathrm{mg}, \quad 80 \%$ ). Mp $215-216{ }^{\circ} \mathrm{C}$; ${ }^{1} \mathrm{H}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}\right.$, $400 \mathrm{MHz}): \delta 2.47-2.55\left(\mathrm{~m}, 2 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.88-3.02$ (m, $4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 6.46 (broad s, 2 H , pyrrole- $\beta$ ), 6.50 (broad s, 2H, pyrrole- $\beta$ ), 7.20-7.26 (m, 2H, P-Ph-m), 7.337.58 (m, 11H, Ph), 7.85-7.91 (m, 2H, P-Ph-o), 8.48 (broad s, $2 \mathrm{H}, \mathrm{NH}) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\}$ NMR $\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 162 \mathrm{MHz}\right): \delta+51.4$; UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right)$ : $\lambda_{\max }(\varepsilon) 504 \mathrm{~nm}$ (29900); HRMS (FAB) calculated for $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{AuClN}_{2} \mathrm{P}\left(\mathrm{M}^{+}\right)$: 714.1266; Found: $m / z 714.1267$.

### 3.7. Synthesis of 8

A mixture of $\mathbf{4 b}$ ( $10.8 \mathrm{mg}, 0.022 \mathrm{mmol}$ ), $\mathrm{PtCl}_{2}$ ( 3.0 mg , $0.010 \mathrm{mmol})$, and $\mathrm{CH}_{2} \mathrm{Cl}_{2} / \mathrm{MeOH}(2: 1,1.5 \mathrm{~mL})$ was stirred at room temperature. After 3 h , the mixture was concentrated under reduced pressure and then filtered off through a Celite bed. The filtrate was reprecipitated from $\mathrm{CH}_{2} \mathrm{Cl}_{2} /$ hexane to afford $8(8.3 \mathrm{mg}, 67 \%)$ as a trans/cis
mixture (ca. 1:1). Recrystallization of trans-rich 8 from $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane by a slow diffusion method afforded single crystals of trans-isomer as a dark brown solid. trans-8: ${ }^{1} \mathrm{H}$ NMR ( $\left.\mathrm{CD}_{2} \mathrm{Cl}_{2}, 400 \mathrm{MHz}\right): \delta 2.15-2.44\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right)$, 2.71-2.74 (m, 8H, CH2 $\mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 6.43 (broad s, 2H, pyrrole$\beta$ ), 6.55 (broad s, 2 H , pyrrole- $\beta$ ), $7.12-7.25(\mathrm{~m}, 18 \mathrm{H}, \mathrm{Ph}$ and P-Ph-m,p), 7.39-7.42 (m, 8H, Ph), 7.55-7.71 (m, 4H, P-Pho), 9.73 (broad s, $4 \mathrm{H}, \mathrm{NH}) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 162 \mathrm{MHz}\right)$ : $\delta+51.6\left(J_{\text {Pt-P }}=2244 \mathrm{~Hz}\right) ;$ UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\max }(\varepsilon) 450$ (23000), 533 nm (25000); HRMS (FAB) calculated for $\mathrm{C}_{66} \mathrm{H}_{54} \mathrm{~N}_{4} \mathrm{Cl}_{2} \mathrm{P}_{2} \mathrm{Pt} \quad\left(\mathrm{M}^{+}\right)$: 1229.2849. Found: $\mathrm{m} / \mathrm{z}$ 1229.2854. cis-8 (cis/trans $>95 / 5)$ : ${ }^{1} \mathrm{H}$ NMR ( $\mathrm{CDCl}_{3}$, 400 MHz ): $\delta 2.05-2.30\left(\mathrm{~m}, 4 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}\right), 2.30-2.61$ ( $\mathrm{m}, 8 \mathrm{H}, \mathrm{CH}_{2} \mathrm{CH}_{2} \mathrm{CH}_{2}$ ), 6.19 (broad s, 2 H , pyrrole- $\beta$ ), 6.31 (broad s, 2H, pyrrole- $\beta$ ), 7.05-7.34 (m, $18 \mathrm{H}, \mathrm{Ph}$ and $\mathrm{P}-\mathrm{Ph}-$ $m, p$ ), 7.40-7.50 (m, 8H, Ph), 7.61-7.75 (m, 4H, P-Ph-o), 9.79 (broad s, $4 \mathrm{H}, \mathrm{NH}) ;{ }^{31} \mathrm{P}\left\{{ }^{1} \mathrm{H}\right\} \mathrm{NMR}\left(\mathrm{CD}_{2} \mathrm{Cl}_{2}, 162 \mathrm{MHz}\right): \delta+31.5$ ( $J_{\text {Pt-P }}=3177 \mathrm{~Hz}$ ); UV-vis $\left(\mathrm{CH}_{2} \mathrm{Cl}_{2}\right): \lambda_{\text {max }}(\varepsilon) 541 \mathrm{~nm}$; HRMS (FAB) calculated for $\mathrm{C}_{66} \mathrm{H}_{54} \mathrm{~N}_{4} \mathrm{Cl}_{2} \mathrm{P}_{2} \mathrm{Pt}\left(\mathrm{M}^{+}\right)$: 1229.2849. Found: $m / z 1229.2837$.

### 3.8. X-ray structural determination

Single crystals of $\mathbf{5 b}, \mathbf{7}$, and trans- $\mathbf{8}$ were grown from $\mathrm{CH}_{2} \mathrm{Cl}_{2}-\mathrm{MeOH}$ (for $\mathbf{5 b}$ and $\mathbf{7}$ ) or $\mathrm{CH}_{2} \mathrm{Cl}_{2}$-hexane (for $\mathbf{8}$ ). All measurements were made on a Rigaku Mercury-8 CCD area detector with graphite monochromated $\mathrm{Mo}-\mathrm{K} \alpha$ radiation at 143 K . The structures were solved by a direct method (SIR92) [19] and expanded using Fourier techniques [20]. Non-hydrogen atoms were refined anisotropically, and hydrogen atoms were refined using the rigid model. All calculations were performed using CrystalStructure ${ }^{12}$ crystallographic software package except for refinement, which was performed using SHELXL-97 [21]. Crystal data and structural refinement parameters are as follows. $\mathbf{5 b}$ : $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{~N}_{2} \mathrm{OP}$, red block, $0.30 \times 0.20 \times 0.08 \mathrm{~mm}$, $\mathrm{MW}=498.54$, monoclinic, space group $=P 2_{1} / \mathrm{n}, \quad a=$ 11.092(2) $\AA, \quad b=18.861(3) \quad \AA, \quad c=11.952(2) \quad \AA$, $\beta=98.244(2)^{\circ}, V=2474.5(8) \AA^{3}, Z=4, D_{c}=1.338 \mathrm{~g} \mathrm{~cm}^{-3}$, $\mu=1.42 \mathrm{~cm}^{-1}, 28128$ observed, 5653 unique, 335 variables, $R_{w}=0.1239, R=0.0495(I>2.0 \sigma(I)), \mathrm{GOF}=1.152 .7$ : $\mathrm{C}_{33} \mathrm{H}_{27} \mathrm{AuClN}_{2} \mathrm{P}$, red block, $0.25 \times 0.20 \times 0.08 \mathrm{~mm}$, $\mathrm{MW}=$ 714.95, monoclinic, space group $=P 2_{1} / \mathrm{c}, a=11.116(3) \AA$, $b=19.045(5) \quad \AA, \quad c=13.303(4) \quad \AA, \quad \beta=97.365(5)^{\circ}$, $V=2793.1(14) \quad \AA^{3}, \quad Z=4, \quad D_{c}=1.700 \mathrm{~g} \mathrm{~cm}^{-3}, \quad \mu=54.64$ $\mathrm{cm}^{-1}$, 31812 observed, 6257 unique, 344 variables, $R_{w}=0.1311, R=0.0533(I>2.0 \sigma(I)), \mathrm{GOF}=1.175$. trans-8: $\mathrm{C}_{66} \mathrm{H}_{54} \mathrm{Cl}_{2} \mathrm{~N}_{4} \mathrm{P}_{2} \mathrm{Pt}$, dark brown block, $0.25 \times 0.20 \times$ $0.10 \mathrm{~mm}, \mathrm{MW}=1231.06$, monoclinic, space group $=P 2_{1} / \mathrm{c}$, $a=15.424(9) ~ \AA, \quad b=11.803(6) ~ \AA, \quad c=18.046(10) ~ \AA$, $\beta=114.382(8)^{\circ}, V=2992(3) \AA^{3}, Z=2, \quad D_{c}=1.366 \mathrm{~g} \mathrm{~cm}^{-3}$, $\mu=25.30 \mathrm{~cm}^{-1}, 19757$ observed, 6716 unique, 341 variables, $R_{w}=0.1761, R=0.0653(I>2.0 \sigma(I))$, GOF $=1.087$. CCDC-762249 (5b), CCDC-762250 (7), and CCDC-763570 (trans-8) contain the supplementary crystallographic data for this paper. These data can be obtained free of charge

[^9]from The Cambridge Crystallographic Data Centre via www.ccdc.cam.ac.uk/data_request.cif.

### 3.9. Fluorescence lifetime measurements

The time profiles of fluorescence in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ at $21{ }^{\circ} \mathrm{C}$ were measured by a streak camera, using the second harmonic output ( $400 \mathrm{~nm}, 150 \mathrm{fs}$ ) of a Ti:Sapphire regenerative amplifier system as an excitation source. The fluorescence decays of $\mathbf{4 b}$ and $\mathbf{7}$ were well fitted by the single exponential component.

### 3.10. Computational details

The geometry optimization was performed by the B3LYP method [22] with basis sets of 6-31G* [23] for C, H , $\mathrm{N}, \mathrm{O}, \mathrm{P}$, and Cl atoms and LANL2DZ [24] for Pt and Au atoms. X-ray structures are used as initial geometries for 7 m and $\mathbf{8 m}$. We carried out vibration analysis with the B3LYP method to ascertain that each optimized geometry was not in saddle but in equilibrium points. The excited states and oscillator strengths are evaluated by the TD-B3LYP method, where forty excited states were solved. In Table 2, the states whose oscillator strengths are less than 0.2 are not included. All calculations were carried out with the Gaussian 03 package [25].

## Acknowledgment

We thank Dr. Yoshihide Nakao (Kyoto University) for his valuable suggestions about DFT calculations. We also thank Prof. Hiroko Yamada and Mr. Daiki Kuzuhara (Ehime University) for the measurement of absolute fluorescence quantum yield of $\mathbf{4} \mathbf{b}$ and Prof. Yoshifumi Kimura (Kyoto University) for the measurement of fluorescence lifetimes of $\mathbf{4 b}$ and 7. This work was supported by a Grant-in-Aid for Scientific Research on Innovative Areas (No. 21108511, " $\pi$ Space") from the Ministry of Education, Culture, Sports, Science and Technology, Japan.

[^0]:    ${ }^{1}$ HOMO energies of pyrrole, benzene, thiophene, pyridine, and phosphole calculated at B3LYP/6-31G* level are $-5.48,-6.70,-6.33$, -6.87 , and -6.25 eV , respectively.

[^1]:    * Corresponding author.

    E-mail address: matano@scl.kyoto-u.ac.jp (Y. Matano).

[^2]:    ${ }^{2}$ In 1998, Mathey et al. reported the synthesis of 2-(1-methyl-2pyrrolyl)phospholes via a base-promoted [1,5]-sigmatropic shift of the pyrrolyl group from the phosphorus atom to the $\alpha$ carbon.
    ${ }^{3}$ Tomita et al. and Tanaka et al. used a similar protocol for the synthesis of phosphole-phenylene copolymers and phosphole-cored dendrimers, respectively.

[^3]:    ${ }^{4}$ Optical data ( $\lambda_{\mathrm{ab}} / \mathrm{nm}, \lambda_{\mathrm{em}} / \mathrm{nm}$, and $\Phi_{\mathrm{f}}$; measured in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ ) for 3,4-trimethylene-1,2,5-triphenylphosphole $P$-oxide are 386,491 , and 0.19 , respectively.

[^4]:    ${ }^{5}$ The N-O distances for typical NH-O hydrogen bonds were reported to be ca. $3 \AA(\max 3.25 \AA)$.

[^5]:    ${ }^{6}$ Optical data ( $\lambda_{\mathrm{ab}} / \mathrm{nm}, \lambda_{\mathrm{em}} / \mathrm{nm}$, $\Phi_{\mathrm{f}}$; measured in THF) for selected 2,5-diaryl-3,4-tetramethylene-1-phenylphosphole derivatives reported by Réau's group [4d] and Tanaka's group [8b]: The $\mathrm{O}^{3}-\mathrm{P}$ series: $\mathrm{Ar}=$ phenyl (354, 466, 0.143); Ar = 2-thienyl (412, 501, 0.050); Ar = 2-pyridyl (390, 463, 0.011). The $\mathrm{O}^{4}-\mathrm{P}=\mathrm{O}$ series: $\mathrm{Ar}=$ phenyl $(370,505,0.0012)$; $\mathrm{Ar}=2-$ thienyl (434, 556, 0.0069). The $\mathrm{O}^{4}-\mathrm{P}=\mathrm{S}$ series: $\mathrm{Ar}=2$-thienyl ( 432,548 , $0.046)$; $\mathrm{Ar}=2$-pyridyl ( $364,470,0.00004$ ). For details on the measurement conditions, see the original references.
    ${ }^{7}$ The fluorescent lifetimes ( $\tau_{f}$ ) of $\mathbf{4 b}$ and $\mathbf{7}$ in $\mathrm{CH}_{2} \mathrm{Cl}_{2}$ were determined to be 3.50 ns and 1.54 ns , respectively. With the $\tau \mathrm{f}$ and $\Phi \mathrm{f}$ values (Table 1), radiative rate constants from the $S_{1}$ states of $\mathbf{4 b}$ and 7 were determined as $2.2 \times 10^{8} \mathrm{~s}^{-1}$ and $5.8 \times 10^{7} \mathrm{~s}^{-1}$, respectively.

[^6]:    ${ }^{8}$ Redox potentials ( $E_{\mathrm{pa}} / \mathrm{V}, E_{\mathrm{pc}} / \mathrm{V}$; measured in THF) for selected 2,5-diaryl-3,4-tetramethylene-1-phenylphosphole derivatives reported by Réau's group [4d]: The $\sigma^{3}-\mathrm{P}$ series: $\mathrm{Ar}=$ phenyl ( $+0.69,-2.88$ ); $\mathrm{Ar}=2$ thienyl ( $+0.40,-$ ); $\mathrm{Ar}=2$-pyridyl ( $+0.83,-2.45$ ). The $\sigma^{4}-\mathrm{P}=0$ series: $\mathrm{Ar}=2$-thienyl $(+0.63,-2.03)$. The $\sigma^{4}-\mathrm{P}=\mathrm{S}$ series: $\mathrm{Ar}=2$-thienyl (+0.68, $-1.95)$; $\mathrm{Ar}=2$-pyridyl ( $+1.43,-1.88$ ). For details on the measurement conditions, see the original references.

[^7]:    ${ }^{9}$ Réau et al. and Baumgartner et al. investigated this topic extensively.

[^8]:    ${ }^{10}$ The $\mathrm{N} \bullet \bullet \mathrm{Cl}$ distances of trans- $\mathrm{PtCl}_{2}$ complexes of phosphole-containing calix[4]pyrroles having $\mathrm{N}-\mathrm{H} \bullet \bullet \bullet \mathrm{Cl}-\mathrm{Pt}$ hydrogen bonds are $3.18-3.52 \AA$.
    ${ }^{11}$ We could not isolate cis-8 in a completely pure form and hence its spectrum is not included in Fig. 2. It should be mentioned, however, that cis-rich 8 ( $>95 \%$, determined by ${ }^{1} \mathrm{H}$ NMR) showed one broad absorption band at $\lambda$ ab 541 nm in CH 2 Cl 2 . In this paper, we do not discuss the observed difference in spectral shape between cis-8 and trans- 8 because no structural information is available for the former complex at present.
