Supplementary Figure 1. Seismicity catalogue superimposed on a simplified geological map of the Comoros and Madagascar [Rajaonarison *et al.*, 2020]. Dense seismicity follows the Cenozoic volcanic islands of the Comoros in the northern Mozambique Channel and along the Davie Ridge, and more distributed seismicity occurs across Madagascar. At present, Cenozoic volcanism of northern Madagascar (Massif d’Ambre, Nosy-Be-Antongil axis) is not active seismically.
